

ABSTRACT

An apparatus and method for generating an identifier to facilitate delivery of enhanced data services in a wireless computing environment is presented. In accordance with one aspect of the invention, a method is presented comprising receiving a request to establish a
5 communication session between a subscriber unit in a wireless communication system and a data network access server through a basestation, and selectively generating a communication session identifier to uniquely identify the communication session from a plurality of communication sessions supported by the network access server to enable mobility management within the point-to-point communication session between the basestation and the network access server.
